Heuristic Evaluation Summary

Project name	Better_Jaksec
Team	Elias Rinne, Leevi Laune, Sakari Honkavaara
Date	21.4.2026
Version / Sprint	1.0 / Sprint 7
Evaluated flow / page	Combined team summary
Repository	https://github.com/MustBeViable/Better_Jaksec
Evaluation process	Each team member completed the heuristic evaluation independently. After that, we held a team review session to compare the results. During the session, we removed duplicate findings, clarified unclear observations, grouped related issues, and agreed on the final list of problems.
Confirmed findings and Sprint 9 follow-up	All confirmed usability issues and bugs are documented in the evaluation summary. The team will process these findings in Sprint 9 by prioritizing them, assigning responsibility, and deciding whether each item will be fixed during the sprint or moved to the backlog.

Single table summarizing issues found for each heuristic by all members. Severity uses the middle value across the three evaluators; a missing issue in an individual report is treated as 0.

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
1	H1-1: Simple & natural dialog	Course and main views are not immediately clear. Key actions, page purpose, and course-management actions can be hard to understand at first.		2	Clarify page purpose with stronger hierarchy, clearer primary actions, and short guidance for course-management tasks.
2	H1-2: Speak the users' language	Some labels and interface wording are unclear or misleading for teachers and first-time users.		1	Use clearer, more descriptive labels and action names that match users' expectations.
3	H1-3: Minimize users' memory load	Users must remember too much. Attendance marking requires a long path, the main page gives little guidance, and the login form lacks a show-password option.	N/A	2	Reduce memory load with clearer entry points, simpler task flows, and a show-password toggle.

Heuristic Evaluation Summary

4	H1-4: Consistency	Visual and informational consistency varies between pages. Some option boxes, QR views, layouts, and lesson details do not match the rest of the interface.		1	Apply one shared design system for layouts, component styling, and key information placement across views.
5	H1-5: Feedback	System feedback is inconsistent. Some actions lack clear success or failure messages, attendance state can be lost on refresh, and QR scanning feedback is delayed or unclear.	N/A	2	Add immediate status feedback, confirm saved changes clearly, and preserve or autosave attendance state.
6	H1-6: Clearly marked exits	Exit and next-step paths are not always obvious. Some flows lack prominent cancel or back options, and the QR reader especially needs a clearer way out.	N/A	2	Make back, cancel, close, and next-step actions visible and consistent in every flow.

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
7	H1-7: Shortcuts	Frequent teacher tasks require repetitive manual work, and there are no strong shortcuts for experienced users.	N/A	2	Add efficiency features such as 'Mark all present', quicker access paths, and task shortcuts.
8	H1-8: Precise & constructive error messages	Error messages are often too generic and do not clearly explain what went wrong, which field caused the issue, or how the user can fix it.		2	Show precise, field-level error messages with clear correction guidance.
9	H1-9: Prevent errors	The interface does not prevent several common mistakes. Destructive actions may happen without confirmation, attendance state may be lost, and some problems are only discovered after the fact.		3	Prevent mistakes with confirmations, autosave or state persistence, validation before submission, and undo where possible.

10	H1-10: Help and documentation	The system provides very little built-in help for new users. There is no clear FAQ, help view, or task guidance.	N/A	1	Add a help section, onboarding guidance, tooltips, or short instructions for key features.
